Head Anatomy

The head is divided into two main regions: the cranium and the face. The cranium houses the brain and is made up of eight bones that are joined together by sutures. The face consists of 14 bones that form the facial skeleton. The muscles of the head are responsible for facial expressions, chewing, and swallowing.

Neck Anatomy

The neck is a muscular structure that connects the head to the body. It contains the trachea, esophagus, and major blood vessels. The muscles of the neck are responsible for turning the head, nodding, and swallowing.

Brain Anatomy

The brain is the center of the nervous system and is responsible for controlling all bodily functions. It is divided into three main parts: the forebrain, midbrain, and hindbrain. The forebrain contains the cerebrum, which is responsible for higher-level functions such as thought, language, and memory. The midbrain contains the brainstem, which is responsible for controlling vital functions such as breathing, heart rate, and blood pressure. The hindbrain contains the cerebellum, which is responsible for coordination and balance.
